

# Uber UI/UX Redesign Assignment

**Project Focus:** Enhancing Navigation & Discovery

**Objective:** Uber's transition into a "super app" has created cognitive overload on the home screen. The goal of this redesign is to separate immediate intent (booking a ride) from discovery (finding food, grocery, and promos) by streamlining the Information Architecture and User Flows.

## 1. Information Architecture (Current Uber App)

The current architecture suffers from redundant categorization. The "Services" tab repeats much of what is already presented in the primary grid on the Home screen, causing navigational friction.

## 2. Information Architecture (Redesigned App)

By replacing the redundant "Services" tab with an "Explore" tab, we create a dedicated hub for discovery. This allows the Home screen to focus purely on high-intent actions (getting from A to B).

### Redesigned Bottom Nav Bar

#### Home (Intent Focus)

Optimized

- Smart Search Bar ("Where to?") + Saved Places
- Interactive Map (Always visible)
- Quick Action Pills (Ride, Package, Reserve)

#### Explore (Discovery Focus)

New

- Categories (Food, Grocery, Transit, Rental)
- Personalized Offers & Promos
- New Features (Uber Pet, Connect)

#### Activity

- Active Orders/Rides (Live Tracking)
- History & Receipts

#### Profile

Consolidated

- Wallet & Rewards (Uber One)
- Settings, Safety & Support

### 3. User Flow: Booking a Ride (Current)

The existing flow requires users to parse a cluttered home screen, type out destinations manually, and scroll through an overwhelming list of ride tiers.

#### Step 1: Open App

User launches app and lands on the cluttered Home Screen.

#### Step 2: Initiate Search

User scans the grid of services, locates and taps the "Ride" icon or "Where to?" bar.

#### Step 3: Enter Destination

Keyboard opens. User types destination and selects from the dropdown list.

#### Step 4: Confirm Pickup

Map UI loads. User verifies Pickup Location and taps "Confirm Pickup" button.

#### Step 5: Ride Selection

User scrolls through a long vertical list of tiers (UberX, Comfort, Premier, Shared) to compare prices.

#### Step 6: Checkout

User selects a ride, clears the Safety/Payment confirmation popup, and waits for a driver.

## 4. User Flow: Booking a Ride (Redesigned)

The new flow uses predictive intelligence to reduce taps. Contextual suggestions surface destinations based on time/habits, and the ride selection UI is simplified into intent-based categories.

### Step 1: Open App to Action Hub

App opens to a map-forward layout. Predictive contextual suggestion appears below search (e.g., "Heading Home?").

### Step 2: Quick Selection Frictionless

**Path A:** User taps the predictive "Home" pill (1 tap).

**Path B:** User taps "Where to?" and types a custom destination.

### Step 3: Unified Map UI

Destination sets and Pickup location is auto-verified with high accuracy in a single automated step.

### Step 4: Categorized Ride Selection Simplified

Instead of an endless scroll, user views horizontal swipe cards strictly categorized by intent: "Fastest", "Cheapest", "Premium".

### Step 5: Confirm & Discover

User swipes "Confirm & Go". While waiting on the "Finding your ride" screen, a subtle prompt encourages browsing the new "Explore" tab.
